

Response Codes

The success of an operation is reported as the HTTP response status in the web service response. For further information see: <http://www.w3.org/Protocols/rfc2616/rfc2616-sec10.html>.

Status	Message	Description
200	OK	When an operation completed without an error.
201	Created	When the creation of a new resource completed with out an error.
204	No Content	When the modification of a new resource completed without an error.
304	Not modified	When a conditional request was sent and the preconditions failed.
400	Bad request	The request format was invalid, or required GET or POST parameters were missing.
401	Unauthorized	The client has not provided authentication information.
403	Forbidden	The client was not authorized to perform the request.
404	Not found	When either the requested resource or a resource reference by the request cannot be found.
409	Conflict	When a request would result in an inconsistent state on the server, this response is sent.
410	Gone	Indicates that a resource referenced by the request is no longer available.
500	Internal server error	An error on the server has occurred and the request could not be completed successfully.

For error responses, the response includes a detailed description of the error condition in the response body.
